To Whom it May Concern:

Delta Center Stage is a community theatre operating in Greenville, MS. Under the current worldwide viral outbreak, and under the terms of national guidance and CDC recommendations, we, and all other theatres nationwide have had no choice but to shut down completely. In the existence of virtually any public gathering crowd size restrictions, it is impossible for us to even begin the process of creating a stage event or to open our doors to the public.

As a response to these conditions, I called a medical task force in to examine what actions we should take with the open question being "What can we do to resume operations in the safest possible manner?" Out of this called meeting of local medical professionals, we were made aware of the UVAIRx products utilizing PCO technology and the ability of this technology to clear the air and surfaces of a wide spectrum of microbes and other organic contaminants.

Thanks to the personal service and cooperation of UVAIRx management, (we are a 501(c)3 non profit) we were shipped enough UVAIRx HVAC duct mounted units to cover all of the areas in which we operate, both rehearsal and public performance spaces.

The most important net effect of this installation is that we will have a powerful tool to which we can point as an assurance to our general audiences and also our rehearsal participants that we are doing all that we can, through this technology, along with other common-sense procedures, to positively take action to protect any and all under our roof from viral spread.

Although we could not afford an expensive scientific test, our own swab tests of air and surfaces after installation of this equipment gives us confidence that the technology is working. We were able to detect virtually zero presence of airborne microbes in treated air, and a significant, substantial reduction in the presence of mold and bacteria on surfaces. Given other research materials on the effectiveness of this technology on viral material, we can confidently infer from our own real-world observations that the equipment is acting upon these pathogens as well.

Sincerely

Tim Bixler
